

KODAK RELIABLE IMAGE TIP # 3

The Extek 3441 Silver Duplicator is designed for acetate base film duplication. Some of the key differences in this unit vs other silver duplicators are as follows:

- ★ There is no vacuum chamber
- ★ It has a glass cylinder and belt much like that of a Diazo duplicator
- ★ It has variable speed and variable exposure.

In some cases, I have seen the speed set to 25 Ft. per minute for acetate film due to its condition. The same appearing images on polyester would allow for a speed of 300 to 350 Ft. per minute.
